

Pulsar Analytics - Troubleshooting Guide

Version 1.8 - May 2026

1. Common errors

Dashboard shows "stale": the underlying data source has not refreshed. Open the dashboard, click the data-source name in the footer, and choose Refresh now. See the data-and-integrations guide for refresh cadence defaults.

Query failed with 429: the workspace is rate-limited. Wait for the time indicated in the Retry-After header (usually 30 to 60) Tj 0 -20 Td (seconds) and retry. If you repeatedly raise your workspace quota.

Sign-in loop: your session cookie is stale. Sign out from the account menu, then sign back in. If the loop persists, clear the browser cookies for app.pulsaranalytics.io and try again.

2. Status page

Live system status is at status.pulsaranalytics.io. Pulsar posts incidents, planned maintenance, and historical uptime there. Subscribe with email or Slack to receive notifications.

3. Diagnostic info

When you contact support, please include your workspace id found in Settings > General, your account email, the time of the issue (with timezone), and a screenshot of the error toast.

4. Support contact

Starter: community forum only.

Team: email support, 1 business day response.

Business: priority email, 4 business hour response.

Enterprise: dedicated CSM, 1 business hour response, 24x7

5. Reporting a security issue

Email security@pulsaranalytics.io or use the in-app Report a security issue link from the help menu. Pulsar's security team acknowledges within 1 business hour and aims to remediate
