

1. Change your password

Open Settings > Security > Password. Enter your current password and then a new password of at least 12 characters. Pulsar enforces one uppercase, one lowercase, one digit, and one symbol. After saving, all other sessions are signed out automatically.

2. Two-factor authentication

Settings > Security > Two-factor authentication. Pulsar supports TOTP authenticator apps (Google Authenticator, 1Password, Authy) and hardware keys (FIDO2 / WebAuthn). Once enabled, sign-in requires both your password and a 6-digit code from your device.

3. Session management

Settings > Security > Active sessions lists every device and browser where you are signed in, with the IP, location, and last active time. Click Sign out to end any individual session, or Sign out everywhere to end all sessions except this one.

4. API tokens

Settings > Security > API tokens. Create a token with a name and scope (read-only, read-write, or admin). Pulsar shows the token value once at creation; copy and store it securely. Revoke a token at any time from the same page.

5. Lost 2FA device

If you lose the device that holds your 2FA codes, you can use a saved recovery code to sign in. Each member gets ten recovery codes at 2FA setup; each code works once. If you have used all of your recovery codes, contact support and a security engineer will verify your identity and reset 2FA on the workspace within 1 business hour. The bot will open a security ticket for you automatically.
